

Case Study: Seamless Flooring Systems

Reginson Engineering

Client: Reginson Engineering

Commenced: 9th January 2015

Completed: 27th February 2015

Area Coverage: 1,560m²

Project Description

Reginson Engineering, who specialise in sub contract precision engineering, CNC machining, milling and turning, required improvements to the appearance of their 1,560m² High Tech facility in Nuneaton. They asked Zenith Pola Flooring to provide a specification which would provide a hard wearing and aesthetically pleasing solution.

Zenith Pola Flooring recommended using polyurethane screed to the gangways at 6mm thickness, which would more than cope with the intense traffic the floor will receive and comes in a variety of colours. The machine shop areas were specified with a high build epoxy resin broadcast system incorporating a quartz aggregate to provide slip resistance whilst retaining ease of cleaning.

The works were carried out over six weekend periods to reduce disruption to the client's production. A colour scheme of Blue (gangways) light grey (machine shop) and red (inspection areas and goods in) was introduced.

Products & Systems Used

Pumador R.T
Resucoat H.B

Zenith Pola Flooring delivered exactly what we required, on time and to a high standard, we are more than pleased with the result □
